

# SenditCertified™ for Business Professionals

## “Easy as Email” Secure Business Communications

- End-to-end AES 256-bit encryption (the strongest commercially available)
- Multi-factor recipient authentication (including fingerprint scan, if desired)
- Attachments (e.g. engineering diagrams) of virtually any size
- Encrypted message storage, failsafe backup
- Proven chain of custody meets regulatory compliance standards
- Send and receive from anyone; they don't need an account
- Almost no set-up time or end-use training
- No special hardware, software or IT impact
- Fits easily within established business workflows

When you try to protect what you send over the Internet you face bigger challenges than larger companies face. Like them, you also have trade secrets, new-business proposals, company financials, personnel data and other sensitive information you need to communicate to the outside world. But unlike big companies, you may lack a large, complex and expensive cyber security infrastructure. Well, now you don't need one to send and receive confidential information securely over the Internet. SenditCertified is the ultra secure and far less expensive alternative. It's as easy as email to use and it's even easier and faster than email to set up.

### **SenditCertified can save your business.**

You risk your business whenever you send sensitive information in regular email. If information leaks, you might get sued. You might compromise your position in a negotiation. You might lose a deal or a customer. Or a lot of customers.

The problem is — for many business professionals, “industrial strength” security solutions are out of reach. And most are incredibly hard to implement. Not SenditCertified. It lets you start protecting your information, and your business, right now. There's no special software to install – no extra burden on IT staff.

---

It's as easy as email to send large files plus voice notes, recorded video, and text in a single message to anyone. SenditCertified enables true, rapid and protected communications. Don't wait for package delivery or batch files to “get there overnight.”

# With SenditCertified™, you can exchange sensitive information in a secure manner with virtually anyone, today.

## Your Most Critical Email Should Not Be Email

Your most important email, the kind that really impacts your company, should not be sent using regular email. Instead it should be sent as an ePackage — using SenditCertified. Regular email may be intercepted anywhere along its path, including at any server an email may traverse, of which there may be dozens. Unlike regular email, ePackages are AES 256-bit encrypted— the highest level in commercial use today. Furthermore, they only travel through a single, highly protected server. A multi-layer four-step process protects private information end-to-end ensuring the most rigorous info policy compliance:

- The message (including all attachments) is encrypted as an ePackage on the sender's computer using a standard web browser.
- The ePackage travels over an encrypted pathway directly to an secure vault on a protected server.
- The ePackage is delivered over another encrypted private path directly to the recipient.
- To open the message recipients must authenticate themselves by fingerprint scan, digital signature, access code, or any combination.

## A Proven Chain of Custody

From sender – to protected server – to recipient, proof of custody and non-repudiation are inherent. Recipients can never deny receipt of a message. All ePackages reside in a private area: "My Vault." Your vault is specific to your account and hosted in a high security facility – for failsafe backup, retrieval, management and audit whenever necessary.

## Let Anyone Communicate with you in Private

Clients, potential investors — even your paid advisors — may not communicate with you if they can't do so privately. Now they can whenever they need to ... with the Corporate Secure Inbox (CSI). The Corporate Secure Inbox allows anyone you authorize to send a SenditCertified ePackage to you, knowing it will be secure. They don't even need a SenditCertified account — just a standard web browser.

## Host on Our Server or Yours

Remote hosting means there's nothing for you to install, configure, maintain, operate or upgrade. However, if you prefer, we can install and set up our server software at your office and also provide follow-up training and support.

## System Requirements

- Internet connected computer with MS Internet Explorer, Safari, Firefox, Opera or Chrome with Java and Active X
- Voice recording feature requires built-in or USB speakers and microphone
- Video recording feature requires a built-in or USB camera
- Fingerprint scan option requires a portable USB or built-in scanner (available on many laptop computers)
